

## Asymptotic Analysis

- Runtime Analysis and Big Oh -  $O(\cdot)$
- Complexity Classes and Curse of Exponential Time
- $\Omega(\cdot)$ ,  $\Theta(\cdot)$ ,  $o(\cdot)$ ,  $\omega(\cdot)$  - Relational properties

IMDAD ULLAH KHAN

# Asymptotic Lower Bound

## Definition ( $\Omega$ (Big Omega))

A function  $g(n) \in \Omega(f(n))$  if there exists constant  $c > 0$  and  $n_0 \geq 0$  such that

$$\forall n \geq n_0 \quad g(n) \geq c(f(n))$$

- Written as:  $g(n) = \Omega(f(n))$
- $f(n)$  is an asymptotic lower bounded for  $g(n)$
- $g(n) \in O(f(n)) \Leftrightarrow f(n) \in \Omega(g(n))$
- The definition of  $\Omega$  works just like  $O(\cdot)$ , except that the function  $g(n)$  is bounded from below, rather than from above
- A notion of  $a \geq b$  for functions as for real numbers

## Big Omega: Example

---

1  $3n^2 + 4n + 5 \in \Omega(n^2)$

2  $3n^2 + 4n + 5 \in \Omega(n)$

3  $3n^2 + 4n + 5 \neq \Omega(n^3)$

# Asymptotic Tight Bounds

## Definition ( $\Theta$ (Big Theta))

A function  $g(n)$  is  $\Theta(n)$  iff there exists two positive real constants  $c_1$  and  $c_2$  and a positive integer  $n_0$  such that

$$\forall n > n_0 \quad c_1 f(n) \leq g(n) \leq c_2 f(n)$$

- $g(n) \in O(f(n))$  and  $g(n) \in \Omega(f(n)) \Leftrightarrow g(n) \in \Theta(f(n))$
- Asymptotically tight bounds on worst-case running times characterize the performance of an algorithm precisely up to constant factors

## Asymptotic Tight Bounds - Big $\Theta$ Notation

---

- $f(n) = pn^2 + qn + r$

$$f(n) \in \Omega(n^2) \text{ AND } f(n) \in O(n^2) \implies f(n) \in \Theta(n^2)$$

▷  $p, q, r$  are positive constants

- $3n^2 + 4n + 5 \in \Theta(n^2)$

- $3n^2 + 4n + 5 \notin \Theta(n^3)$

- $3n^2 + 4n + 5 \notin \Theta(n)$

# Little Oh - o Notation

## Definition

A function  $g(n) \in o(f(n))$  if for every constant  $c > 0$ , there exists a constant  $n_0 \geq 0$  such that

$$\forall n \geq n_0 \quad g(n) \leq cf(n)$$

- Written as:  $g(n) \in o(f(n))$
- This is used to show that  $g$  grows much much slower than  $f$
- $f(n) \in o(g(n)) \Leftrightarrow (f(n) \in O(g(n)) \wedge f(n) \notin \Theta(g(n)))$
- An equivalent formulation (when  $f(n)$  is non-zero) is given as

$$\lim_{n \rightarrow \infty} \frac{g(n)}{f(n)} = 0$$

## Little Oh - Examples

---

1  $3n^2 + 4n + 5 \notin o(n^2)$

2  $3n^2 + 4n + 5 \in o(n^3)$

3  $3n^2 + 4n + 5 \notin o(n)$

# Little omega - $\omega$ Notation

## Definition

A function  $g(n) \in \omega(f(n))$  if for every constant  $c > 0$ , there exists constant  $n_0 \geq 0$  such that

$$\forall n \geq n_0 \quad g(n) \geq cf(n)$$

- Written as:  $g(n) \in \omega(f(n))$
- In this case  $f$  grows much faster than  $g$ .
- $f(n) \in \omega(g(n)) \Leftrightarrow (f(n) \in \Omega(g(n)) \wedge f(n) \notin \Theta(g(n)))$

## Little omega: Examples

---

1  $3n^2 + 4n + 5 \notin \omega(n^2)$

2  $3n^2 + 4n + 5 \in \omega(n)$

3  $3n^2 + 4n + 5 \notin \omega(n^3)$

# Properties of Asymptotic Growth Rates

---

Many relational properties of real numbers apply to asymptotic comparisons

For the following, assume that  $f$  and  $g$  are asymptotically positive

## Transitivity

- 1 If  $f \in O(g)$  and  $g \in O(h)$ , then  $f \in O(h)$
- 2 If  $f \in \Omega(g)$  and  $g \in \Omega(h)$ , then  $f \in \Omega(h)$
- 3 if  $f \in \Theta(g)$  and  $g \in \Theta(h)$ , then  $f \in \Theta(h)$

# Properties of Asymptotic Growth Rates

---

## Reflexivity

- 1  $f \in O(f)$
- 2  $f \in \Omega(f)$
- 3  $f \in \Theta(f)$

## Additivity

- If  $f \in O(h)$  and  $g \in O(h)$ , then  $f + g \in O(h)$
- In general, for constant  $k$ , if  $f_1, f_2, \dots, f_k$  and  $h$  are functions such that for all  $i$ ,  $f_i \in O(h)$ . Then  $f_1 + f_2 + \dots + f_k \in O(h)$

# Properties of Asymptotic Growth Rates

---

## Symmetry

- 1  $f \in \Theta(g)$  if and only if  $g \in \Theta(f)$

## Transpose Symmetry

- 1  $f \in O(g)$  if and only if  $g \in \Omega(f)$
- 2  $f \in o(g)$  if and only if  $g \in \omega(f)$
