# **Dynamic Programming**

- (Weighted) Independent Set in Graphs
- Weighted Independent Sets in Path
- Dynamic Programming Formulation
- Implementation and Backtracking

IMDAD ULLAH KHAN

**Input:** A node weighted path graph P = (V, E),  $w : V \to \mathbb{R}^+$ 

Output: An independent set of P of maximum weight

**Input:** A node weighted path graph P = (V, E),  $w : V \to \mathbb{R}^+$ 

**Output:** An independent set of *P* of maximum weight

Notation: Think of P as a sequence of vertices  $v_1, v_2, \ldots, v_n$ 

■  $P_k$ : The (sub)path induced by  $v_1, v_2, \ldots, v_k$ 

- ightharpoonup OPT-SET(k): An optimal independent set in  $P_k$
- $ightharpoonup ext{OPT-VAL}(k)$ : Value of an optimal independent set in  $P_k$

Our goal is to find OPT-SET(n) and OPT-VAL(n)

Argue about structure of the solution (though we can't compute it)

See how solution is composed of that to smaller subproblems

- Either  $v_n$  is part of the optimal solution, OPT-SET(n)
  - $w_n$  is counted in OPT-VAL(n)
  - Node  $v_{n-1}$  is not part of the OPT-SET(n)
  - Analyze solution to  $P_{n-2}$   $(v_1, v_2, ..., v_{n-2})$
- Or  $v_n$  is not part of the optimal solution, OPT-SET(n)
  - $w_n$  is not counted in OPT-VAL(n)
  - Node  $v_{n-1}$  may or may not be part of OPT-SET(n)
  - Analyze solution to  $P_{n-1}$   $(v_1, v_2, ..., v_{n-1})$
- Analyze solution to  $P_{n-2}$  and  $P_{n-1}$ ?

### Analyze solution to $P_{n-2}$ and $P_{n-1}$ ?

- $v_n \notin \text{OPT-SET}(n)$ 
  - OPT-SET(n) is an independent set in  $P_{n-1}$
  - lacktriangle OPT-SET(n) is a maximum WIS in  $P_{n-1}$ 
    - Let  $A \subset P_{n-1}$  be an independent set with wt(A) > OPT-VAL(n)
    - $\blacksquare$  A is also an independent set in  $P_n$
    - It contradicts optimality of OPT-SET(n)
- $\mathbf{v}_n \in \text{OPT-SET}(n)$ 
  - $v_{n-1} \notin \text{OPT-SET}(n)$
  - OPT-SET $(n) \setminus \{v_n\}$  is an independent set in  $P_{n-2}$
  - lacktriangledown OPT-SET $(n)\setminus\{v_n\}$  is a maximum WIS in  $P_{n-2}$ 
    - Let  $A \subset P_{n-2}$  be an independent set with  $wt(A) > \text{OPT-VAL}(n) w_n$
    - $A \cup \{v_n\}$  is an independent set in  $P_n$
    - It contradicts optimality of OPT-SET(n)

A max WIS in  $P_n$  is  $\begin{cases} \text{either a max WIS in } P_{n-1} \\ \text{or it is } v_n \text{ union with a max WIS in } P_{n-2} \end{cases}$ 

Optimal Substructure Property: "an optimal solution can be constructed from optimal solutions of subproblems"

A max WIS in 
$$P_n$$
 is  $\begin{cases} \text{either a max WIS in } P_{n-1} \\ \text{or it is } v_n \text{ union with a max WIS in } P_{n-2} \end{cases}$ 

$$\text{OPT-VAL}(n) = \max \begin{cases} \text{OPT-VAL}(n-2) + w_n & \text{if } v_n \in \text{OPT-SET}(n) \\ \text{OPT-VAL}(n-1) & \text{if } v_n \notin \text{OPT-SET}(n) \end{cases}$$

In general,

$$\text{OPT-VAL}(k) = \max \begin{cases} \text{OPT-VAL}(k-2) + w_k & \text{if } v_k \in \text{OPT-SET}(k) \\ \text{OPT-VAL}(k-1) & \text{if } v_k \notin \text{OPT-SET}(k) \end{cases}$$

We don't know bases cases and which branch to take

▷ i.e. the if condition cannot be evaluated

#### Recursion

- If  $v_n \in \text{OPT-SET}(n)$ , then recursively find max WIS in  $P_{n-2}$
- If  $v_n \notin \text{OPT-SET}(n)$ , then recursively find max WIS in  $P_{n-1}$

We don't know bases cases and which branch to take

$$\text{OPT-VAL}(k) = \max \begin{cases} w_1 & \text{if } k = 1 \\ \max\{w_1, w_2\} & \text{if } k = 2 \\ \text{OPT-VAL}(k-2) + w_k & \text{if } v_k \in \text{OPT-SET}(k) \\ \text{OPT-VAL}(k-1) & \text{if } v_k \notin \text{OPT-SET}(k) \end{cases}$$

Try both branches and select the bigger one

$$\operatorname{OPT-VAL}(k) = \max \begin{cases} w_1 & \text{if } k = 1 \\ \max\{w_1, w_2\} & \text{if } k = 2 \\ \operatorname{OPT-VAL}(k-2) + w_k & \text{if } v_k \in \operatorname{OPT-SET}(k) \\ \operatorname{OPT-VAL}(k-1) & \text{if } v_k \notin \operatorname{OPT-SET}(k) \end{cases}$$

```
Algorithm Recursive OPT-VAL(n)
```

```
function OPT-VAL(k) 
ightharpoonup implements the above recurrence if k=1 then return w_1 else if k=2 then return max\{w_1,w_2\} else return max\{OPT-VAL(k-1),OPT-VAL(k-2)+w_k\}
```
