## SSSP Problem

---

**Input:** A weighted graph  $G$  and a source vertex  $s \in V$

**Output:** Shortest paths from  $s$  to all vertices  $v \in V$

This assumes no negative weight cycle in  $G$

▷ Actually, no negative cycle reachable from the source vertex  $s$  is sufficient

**Input:** A weighted graph  $G$  and a source vertex  $s \in V$

**Output:** Shortest paths from  $s$  to all  $v \in V$  or output a negative cycle

## SSSP Problem: Dynamic Programming Formulation

**Input:** A weighted graph  $G$  and a source vertex  $s \in V$

**Output:** Shortest paths from  $s$  to all  $v \in V$  or output a negative cycle

$\text{OPT}(v, i)$ : minimum weight of a  $s - v$  path that uses at most  $i$  edges

$$\text{OPT}(v, i) = \min \begin{cases} \infty & \text{if } i = 0 \wedge s \neq v \\ 0 & \text{if } i = 0 \wedge s = v \\ \text{OPT}(v, i - 1) \\ \min_{u \in N(v)} \text{OPT}(u, i - 1) + w(uv) \end{cases}$$

Maintain a table of solution for each  $v$  and  $1 \leq i \leq n$  (memo)

A negative cycle is detected if  $\text{OPT}(v, n)$  improves upon  $\text{OPT}(v, n - 1)$

# SSSP Problem: Bellman Ford Algorithm

---

## Algorithm 1 Bellman Ford Algorithm ( $G, s$ )

---

**for** each vertex  $v$  in  $G$  **do**

$d[v] \leftarrow \infty$  ▷  $d[v]$  maintains  $\text{OPT}(v, \cdot)$

$p[v] \leftarrow \text{nil}$  ▷  $p[v]$  is the predecessor of  $v$  on shortest path from  $s$

$d[s] \leftarrow 0$  ▷ The distance from  $s$  to itself is zero

**for**  $i = 1$  to  $|V| - 1$  **do** ▷ Relax all the edges  $|V| - 1$  time

**for** each edge  $(u, v)$  in  $G$  **do**

**if**  $d[v] > d[u] + w(u, v)$  **then** ▷ If the distance can be improved

$d[v] \leftarrow d[u] + w(u, v)$  ▷ Update the distance

$p[v] \leftarrow u$  ▷ Update the predecessor

**for** each edge  $(u, v)$  in  $G$  **do**

**if**  $d[v] > d[u] + w(u, v)$  **then** ▷ If the distance can be improved

**return** “Negative cycle detected – The problem has no solution”

**return**  $d, p$

---

# SSSP Problem: Bellman Ford Algorithm

After Initialization

| $v$ | $d[v]$   | $\pi[v]$ |
|-----|----------|----------|
| $s$ | 0        | NIL      |
| $t$ | $\infty$ | NIL      |
| $x$ | $\infty$ | NIL      |
| $y$ | $\infty$ | NIL      |
| $z$ | $\infty$ | NIL      |

# SSSP Problem: Bellman Ford Algorithm

After the first relaxation iteration

| $v$ | $d[v]$ | $\pi[v]$ |
|-----|--------|----------|
| $s$ | 0      | NIL      |
| $t$ | 6      | $s$      |
| $x$ | -1     | $y$      |
| $y$ | 2      | $t$      |
| $z$ | 4      | $t$      |

## SSSP Problem: Bellman Ford Algorithm

After the second relaxation iteration

| $v$ | $d[v]$ | $\pi[v]$ |
|-----|--------|----------|
| $s$ | 0      | NIL      |
| $t$ | 6      | $s$      |
| $x$ | -1     | $y$      |
| $y$ | 2      | $t$      |
| $z$ | -2     | $x$      |

# SSSP Problem: Bellman Ford Algorithm

After the third relaxation iteration

| $v$ | $d[v]$ | $\pi[v]$ |
|-----|--------|----------|
| $s$ | 0      | NIL      |
| $t$ | 6      | $y$      |
| $x$ | -1     | $y$      |
| $y$ | 2      | $t$      |
| $z$ | -2     | $t$      |

## SSSP Problem: Bellman Ford Algorithm

After the fourth (final) relaxation iteration

| $v$ | $d[v]$ | $\pi[v]$ |
|-----|--------|----------|
| $s$ | 0      | NIL      |
| $t$ | 6      | $s$      |
| $x$ | -1     | $y$      |
| $y$ | 2      | $t$      |
| $z$ | -2     | $x$      |

The fifth relaxation does not change it

# SSSP Problem: Bellman Ford Algorithm

## SSSP Problem: Bellman Ford Algorithm

$$w(\langle s, t, z, s \rangle) = -6$$

In 4 edge relaxations we get

| $v$ | $d[v]$ | $\pi[v]$ |
|-----|--------|----------|
| $s$ | $-24$  | $z$      |
| $t$ | $-12$  | $s$      |
| $x$ | $-19$  | $y$      |
| $y$ | $-16$  | $t$      |
| $z$ | $-14$  | $t$      |

## SSSP Problem: Bellman Ford Algorithm

$$w(\langle s, t, z, s \rangle) = -6$$

After fifth edge relaxations we can still improve using the edge  $(z, s)$

| $v$ | $d[v]$ | $\pi[v]$ |
|-----|--------|----------|
| $s$ | -30    | $z$      |
| $t$ | -18    | $s$      |
| $x$ | -25    | $y$      |
| $y$ | -22    | $t$      |
| $z$ | -20    | $t$      |

## Bellman-Ford Algorithm Finding Negative Cycle

- To find the negative cycle, trace back the predecessor chain from the vertex whose  $d[\cdot]$  decreased in the last step, until we reach a vertex that has already been seen in the chain
- e.g. starting from  $s$ , we have the following predecessor chain:  
 $s, x, z, x, \dots$
- We stop when we see  $x$  for the second time, and we output the cycle  $\langle x, z, s, x \rangle$
- Note this cycle is a subcycle of the original negative cycle in the graph

## Bellman-Ford Algorithm Finding Negative Cycle

---

- $O(n^2)$  subproblems
- $O(deg(v))$  time to compute each entry of the table

Runtime is  $O(n \cdot \sum_v deg(v)) = O(nm)$

The algorithm uses  $O(n)$  space to store the distance and predecessor arrays
